The screenshot displays a software interface for editing technical drawings. The main area shows a complex piping diagram with various components like tanks, pumps, and valves. The drawing is overlaid with several colored annotations: red dashed lines, blue solid lines, and yellow solid lines. A sidebar on the left contains drawing tools such as Undo, Pen, Highlight, and Polygon. A bottom toolbar shows zoom controls (100%) and a trash icon. On the right, a 'Markup History' panel lists 11 entries, all attributed to 'John Smith' with timestamps from December 12, 2014. Below the history panel are 'Sort' and 'Filter' buttons. At the bottom of the drawing area, there is a 'REVISIONS' table.

REV	DESCRIPTION	DATE

not shown because not ready see more... Veeam Backup & Replication 10.0 Beta 9 for Linux Today I received a preview of Veeam Backup & Replication 10.0 beta 9 for Linux. Veeam is always the first to test new releases of their software and I have no doubt it will be great, but I will say this is the first beta release that actually works. I was able to get it installed and running from the ISO image and setup on a VM and get VMs deployed and back them up. For me this is exciting because it is something that has been missing on Linux for me and I love the ease of use and flexibility of Linux. I am super excited and you should be too because Veeam has built some powerful new features into the product. One of the biggest improvements is the RAID capability. There is no product on the market today that can do this and with a 3rd party partner it is built in. When you select this option you can configure an array to be backup device or replication device. If you select the array is a backup device, then you will get the option of mirroring and striping. Each virtual machine you configure can be set to backup to one drive or multiple drives. Veeam will setup automatic of course but you can also do this manually. I am using this feature on an ESX host running VMs and have it all configured to replicate VMs using the sync replication. It has been working great and I was able to go and add more VMs and the system seamlessly added them. It makes disaster recovery a breeze and I can't wait to try it in production. Veeam Backup & Replication 10.0 beta 9 for Linux also supports VMware vSAN and Microsoft Azure and I will do a separate blog post about those features. I've also found that it does not require a reboot to deploy/use the new release. I had to use the beta software a few times but the installation process is pretty smooth. I did have to uninstall the existing Veeam Backup & Replication and install the beta software a couple of times because the paths were off. If you are a Veeam user
